Laboratory Regulations and Safety Rules

1. Do not attempt to operate the machine before receiving the instructions.
2. Before starting any operation on machines, always see that the work piece is mounted and cutting tools tighten first.
3. Disengages all the operating levers and place them in neutral position before starting the machine.
4. Never leave the machine when it is running.
5. Never mount or remove the work piece when machine is running.
6. While machining such metal, which produces fine flying chip always wear goggle or use guard screen.
7. Never wear loose clothing. Tie your sleeves up at wrist. Never handle chips with you bare hands, should use special hook brushes or scrubbers to pull them away from the machine.
8. Do not take measurement of the work piece while the machine is running.
9. Do not try to stop the chuck with your hands.
10. Keep the work place clean and tidy. Never allow the work pieces or other objects to line on the floor around the machine.
11. See that the chuck key is removed after the work piece has been clamped in the chuck.
12. Earthing should be check before starting electrical machine

Experiment No 2

Aim :

Study of drilling machine and different operations performs on it.

Theory

A drill or drilling machine is a tool primarily used for making round holes or drive fasteners. It is fitted with a bit, either a drill or driver, depending on application, secured by chuck. Some powered drills also include a hammer function. Drills vary widely in speed, power, and size.

Components of Drilling Machine

Spindle

The spindle holds the drill or cutting tools and revolves in a fixed position in a sleeve.

Sleeve

The sleeve or quill assembly does not revolve but may slide in its bearing in a direction parallel to its axis. When the sleeve carrying the spindle with a cutting tool is lowered, the cutting tool is fed into the work; and when it's moved upward, the cutting tool is withdrawn from the work. Feed pressure applied to the sleeve by hand or power causes the revolving drill to cut its way into the work a fraction of an mm per revolution.

Column

The column is cylindrical in shape and built rugged and solid. The column supports the head and the sleeve or quill assembly.

Head

The head of the drilling machine is composed of the sleeve, a spindle, an electric motor and feed mechanism. The head is bolted to the column.

Worktable

The worktable is supported on an arm mounted to the column. The worktable can be adjusted vertically to accommodate different heights of work or it can be swung completely out of the way. It may be tilted up to 90 degree in either direction, to allow long pieces to be end or angle drilled.

Base

The base of the drilling machine supports the entire machine and when bolted to the floor, provides for vibration-free operation and best machining accuracy. The top of the base is similar to the worktable and may be equipped with t- slot for mounting work too large for the table.

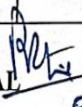

Hand Feed

The hand- feed drilling machines are the simplest and most common type of drilling machines in use today. These are light duty machine that are operated by the operator, using a feed handle, so that the operator is able to "feel" the action of the cutting tool as it cuts through the work piece. These drilling machines can be bench or floor mounted.

Power feed

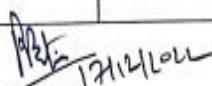

The power feed drilling machine are usually larger and heavier than the hand feed ones they are equipped with the ability to feed the cutting tool in to the work automatically, at preset depth of cut per revolution of the spindle these machines are used in maintenance for medium duty work or the work that uses large drills that require power feed larger work pieces are usually clamped directly to the table or base using t-bolts and clamps by a small work pieces are held in a vise. A depth-stop mechanism is located on the head, near the spindle, to aid in drilling to a precise depth.
